

Project3

Submit the program in pdf file format. You need to finish them after chapter 4.

Description: Use a loop with indirect or indexed addressing to reverse the elements of an integer array in place. Do not copy the elements to any other array. Use the `SIZEOF`, `TYPE`, and `LENGTHOF` operators to make the program as flexible as possible if the array size and type should be changed in the future. Optionally, you may display the modified array by calling the `DumpMem` method from the `Irvine32` library.
